In operation	Blinking in blue	Performing a task				
	Breathing in green	Task completed				
	Breathing in white	Entering the sleep state				
	Blinking in purple	Firmware updating				
Other	Solid red	Exceptions occur				

Maintenance

• Laser cutting or engraving often generates smoke. When the smoke is heavy, the lens of the laser head may become dirty and thus causes power reduction or may even be damaged. When the lens is dirty, clean it with alcohol cotton in time.

• Point blades are consumables. Make sure that you stick the cutting board on the baseplate of xTool MI before using the blade module for material processing. If the blade module fails to work properly, replace the point blade from it in time.

• You may need to lubricate the sliding rods after using them for a long period. Use grease designed for sliding rods.
